GSK Scale AI demo — presenter runbook (30 minutes)

One repo, one story. UC1 *build the data* → UC4 *build the product* → UC3 *run it*. Repo: https://github.com/amitmanchella-cog/gsk-scale-ai-demo · All data is synthetic (seeded generator, 1,600 fake HCPs, 30 reps, 20 territories). No real GSK names, data, CRM or PII anywhere.

The one sentence to land: *Devin is managed infrastructure and governance for software delivery — playbooks and Automations make the engineering standard the default for every team and SI partner, and it complements GSK's agentic factory rather than competing with it.*

Segment	Minutes	Flow doc (read it the night before)
Opening	0:00–1:00	this page, section 1
UC1 — build the data (notebook → tested PySpark job)	1:00–11:00	docs/DEMO_FLOW_UC1.md
UC4 — build the product (Jira PRD → gated SDLC → Field Force Navigator)	11:00–21:00	docs/DEMO_FLOW_UC4.md
UC3 — run it (CI failure → self-heal Automation)	21:00–29:00	docs/DEMO_FLOW_UC3.md
Governance wrap-up	29:00–31:00	this page, section 5

0. Before the call — do these the day before (15 min)

Things only the repo/Jira admin can do; Devin was blocked (HTTP 403) on each:

- [ ] **Make the repo private**: https://github.com/amitmanchella-cog/gsk-scale-ai-demo/settings → Danger zone → Change visibility.
- [ ] **UC4 release gate**: https://github.com/amitmanchella-cog/gsk-scale-ai-demo/settings/environments → `non-prod` → *Required reviewers* → add yourself. Without it the "Review deployments" click at UC4 minute 8:00 never appears.
- [ ] **UC3 trigger check**: open https://github.com/amitmanchella-cog/gsk-scale-ai-demo/pull/3, click *Checks* → failed check → *View workflow run* → *Re-run failed jobs*. Within ~2 min a session tagged `uc3-self-heal` must appear at https://devin-gtm.devinenterprise.com/sessions?tags=uc3-self-heal. If it does not, the `github:check_run` webhook is not reaching Devin — raise it with Cognition and plan to use the Automation page's **Run now** on the call (see UC3 fallback).
- [ ] **Paste the two Automation session URLs** (PR A and PR B) into `docs/DEMO_FLOW_UC3.md` where it says `<<SESSION_URL_A>>` / `<<SESSION_URL_B>>` (open a PR on a `devin/*` branch so the Automation ignores it).
- [ ] **Jira live ticket** https://cog-gtm.atlassian.net/browse/MBA-3651: Story, title *Field Force Navigator: Territory Call Planner*, description = `docs/uc4/PRD.md`, status To Do, zero comments. Do not touch it in rehearsals.
- [ ] Delete the inert one-shot reminder automation `auto-30fe1482b16b405caede15fc61220ef6` (Automations page) — housekeeping only.

1. Opening (1 min)

Minute	Say
0:00	"Three use cases, one repository, one story. A field-force analytics team: first we turn a messy notebook into a production PySpark job, then we build a product on that data from a Jira ticket through a gated SDLC, then we keep it running when CI breaks — all with Devin acting as governed, managed engineering infrastructure. Everything you will see is synthetic data."
0:40	"Watch for three things throughout: the standard lives in a **playbook**, the trigger lives in an **Automation**, and a **human approves** every gate — Devin never approves Devin."

2. UC1 — build the data (10 min) → `docs/DEMO_FLOW_UC1.md`

Tabs to pre-open: messy notebook · merged PR #2 (Files changed) · green CI run 41011065616 · `jobs/territory_kpis.json` · playbook **Notebook to PySpark job** · pre-run session A · second notebook `hcp_engagement.ipynb`.

Minute	Beat	Key click	One line to say
0:00	The messy notebook	https://github.com/amitmanchella-cog/gsk-scale-ai-demo/blob/main/notebooks/territory_kpis.ipynb	"pandas and PySpark in one notebook, hard-coded paths, `toPandas()` mid-pipeline — it will never scale."
1:30	What Devin shipped	https://github.com/amitmanchella-cog/gsk-scale-ai-demo/pull/2/files	"Extract / transform / quality / load, 39 tests, DQ gates, parity check, Databricks job JSON — shown, not run; no Databricks account needed."
3:10	Proof	https://github.com/amitmanchella-cog/gsk-scale-ai-demo/actions/runs/41011065616	"CI says `520 rows compared, 0 mismatches` — GitHub Actions on local Spark, not Devin's claim."
4:00	**LIVE**	Playbook page https://devin-gtm.devinenterprise.com/settings/playbooks/9e1fef4a89a84b19901df5f30c3078e6 → new session on the repo → paste prompt below	"One prompt, four facts; the engineering standard comes from the playbook."

Minute	Beat	Key click	One line to say
7:00	While it runs	Pre-run session https://devin-gtm.devinenterprise.com/sessions/91a1d13228e543a88dd2c86a8dc7ace4	"Parity caught pandas half-even vs Spark half-up rounding — 30 cells — and Devin fixed it. That is why the gate exists."
9:00	Close	Playbook + CI tabs	"Change the playbook once, every future conversion follows. Three CI gates, no credentials."

Prompt to paste (verbatim):

```
Convert notebooks/hcp_engagement.ipynb into pipelines/hcp_engagement/ following the
playbook; parity key hcp_id; expected output
notebooks/expected_output/hcp_engagement.parquet
```

Fallback: after 30 s of nothing, switch to session A and PR #2; come back at 9:00. Never merge a rehearsal PR that creates `pipelines/hcp_engagement/` — the live run needs it absent.

3. UC4 — build the product (10 min) → `docs/DEMO_FLOW_UC4.md`

Tabs: Jira MBA-3651 · new Devin session · fallback session https://devin-gtm.devinenterprise.com/sessions/df5a35cb1f09422ea4363ec7efc72af7 · fallback PR #14 · artefacts on branch `devin/MBA-3650` (requirements.md, design.md, test-report.md) · Jira MBA-3650 · deploy run 41026121962.

Minute	Beat	Key click	One line to say / do
0:00	Ticket = PRD	https://cog-gtm.atlassian.net/browse/MBA-3651	"The only input: one Story — users, three features, six acceptance criteria, named approvers per phase."
1:00	**LIVE** start	New Devin session, paste Prompt B (below)	"Run the whole SDLC against the ticket; stop at every gate for a human."
2:00	Requirements gate (live, ~4 min in)	Live session	You are the Product Owner: read `requirements.md` + sub-tasks, type `APPROVED`.
3:30	Switch to pre-run	Fallback session + PR #14	"Build alone takes ~55 min, so here is the identical prompt run earlier today on a twin ticket."
3:30	Design gate	`design.md` on `devin/MBA-3650`	Tech Lead: mermaid architecture, API contract, scoring example (A + 45 days + open follow-up = 100).

Minute	Beat	Key click	One line to say / do
5:00	Build	PR #14 → Checks	"Five child sessions, one per story, three CI jobs green: lint+tests (100 % scoring coverage), frontend, container."
6:30	Verify gate	`test-report.md` + recording	QA: AC1–AC6 all pass, recorded in a 2 min 23 s browser run.
8:00	Release gate	https://github.com/amitmanchella-cog/gsk-scale-ai-demo/actions/runs/41026121962	Release Manager: `non-prod` environment with required reviewer; image pushed to GHCR; "no cloud target, and Devin said so."
8:40	Ticket closes	https://cog-gtm.atlassian.net/browse/MBA-3650	"Done, five sub-tasks Done, one comment per gate — 80 min prompt-to-Done."
9:50	Back to live	Live session	Show where it has got to; hand off to UC3.

Prompt B to paste (verbatim):

```
Run the full SDLC for Jira ticket MBA-3651 in repo amitmanchella-cog/gsk-scale-ai-demo,
under apps/navigator/. Read the ticket with the Jira MCP; it is the PRD. Data comes from
the UC1 curated tables in pipelines/territory_kpis.
At the end of phases 1, 2 and 4, post the artefact as a Jira comment and STOP until I
reply "APPROVED". Any other reply is a change request.
1 Requirements: docs/uc4/requirements.md + one Jira sub-task per story.
2 Design: docs/uc4/design.md (mermaid architecture, data model, API contract, scoring
worked example, test plan).
3 Build: branch devin/MBA-3651, one child session per story, unit + component tests,
Dockerfile, CI green, one PR linking the ticket and docs.
4 Verify: run the app, test every acceptance criterion, record it, docs/uc4/test-
report.md.
5 Release: deploy job to GitHub Environment "non-prod" with a required reviewer (build and
push the image if there is no cloud target, and say so). Final Jira comment with all
links, then move the ticket to Done.
```

Rules: never approve a phase yourself — you *play* the approvers. Do not merge PR #14 or the live PR on stage. `main` must stay at the clean scaffold `20e748e3`.

4. UC3 — run it (8 min) → `docs/DEMO_FLOW_UC3.md`

Tabs: Automation https://devin-gtm.devinenterprise.com/automations/b09f21a5803c4fb69d049070a961ef94 · PR #3 (A) + its session · PR #4 (B) + its session · PR #5 (C, red, untouched) · sessions filtered by tag `uc3-self-heal` · Actions page.

Minute	Beat	Key click	One line to say
0:00	The Automation	Automation page	"Fires only on a failed check run, only in this repo, never on `main` or `devin/*` branches (loop protection); 10 ACUs per run, 6 runs/hour, 3 concurrent; six allowed hosts; the prompt is the standard: reproduce → regression test that fails first → smallest fix → push to the PR branch → one root-cause comment; never skip or weaken a test."
1:30	PR A — timezone bug	https://github.com/amitmanchella-cog/gsk-scale-ai-demo/pull/3 + its session	"A report ending 23:30 New York was filed under the UTC date — wrong day, wrong week for a Tokyo site. Devin wrote the failing test first, then fixed `to_site_local_date()`."

Minute	Beat	Key click	One line to say
3:30	PR B — broken import	https://github.com/amitmanchella-cog/gsk-scale-ai-demo/pull/4	"Rename updated the caller, not the tests; whole module failed to import. Same guardrails, author's intent kept."
4:30	**LIVE** PR C	https://github.com/amitmanchella-cog/gsk-scale-ai-demo/pull/5 → Checks → failed check → View workflow run → Re-run failed jobs	"I'm re-emitting the failure event, exactly what a push would do." Then refresh the `uc3-self-heal` sessions list.
5:45	Narrate	New session	"Reading the log, reproducing `test_product_default_lead_time_is_six_weeks`, regression test, smallest fix — or it stops and asks because the test and the change disagree on intent. Either is the right behaviour."
6:30	Close	Automation page	"A budget, not a blank cheque; one repo, six hosts, never `main`; PR comment + transcript as audit trail; usage rolls up by tag."

Fallbacks: no session 90 s after the re-run goes red → open the PR A/B sessions and comments, say "trigger latency is webhook delivery, the Automation is queued". If the webhook is known-dead (see section 0), use **Run now** on the Automation page with PR C's run as the event — same prompt, same limits. Mention: the same Automation can be fired from an **Azure Monitor** alert via an action-group webhook to the Devin API.

5. Governance wrap-up (2 min)

Minute	Say	Show
0:00	"**Guardrails** — every Automation and session ran inside a sandbox with a network allowlist, repo scope, `devin/*` branches, never `main`, never a skipped test, never a self-approved gate."	Automation page: trigger, allowlist, prompt
0:30	"**ACU caps** — 10 ACUs per self-heal run, 6 runs an hour, per-story child sessions with their own caps: the cost ceiling is known before the work starts."	Automation limits
1:00	"**Playbooks** — the notebook standard and Prompt B are versioned text any team or SI partner starts from; change it once, everyone follows."	https://devin-gtm.devinenterprise.com/settings/playbooks/9e1fef4a89a84b19901df5f30c3078e6

Minute	Say	Show
1:30	"**Analytics** — sessions are tagged (`gsk-demo`, `uc3-self-heal`), so usage, ACUs and outcomes roll up per tag, team or repo for platform owners."	Devin usage/analytics page, filter by tag
1:50	"GSK's agentic factory decides what to build; Devin is the governed engineering infrastructure that builds, verifies and keeps it running. Complements, doesn't compete."	—
